

Variant	Cycles (M)	vs. no cache	Wallclock	Status
S0 (no cache)	6,354.0	1.00x	12.42 hrs	BASELINE
1-way	8,336.3	1.31x	12.36 hrs	SLOWER
4-way	8,159.1	1.28x	12.67 hrs	SLOWER
8-way	8,508.1	1.34x	13.63 hrs	SLOWER
16-way	...	...	running	PENDING

2000-read workload, sample_targeted (50MB) DB - the SAME DB the fair batch used at 50 reads, where cache already lost to no-cache. This job confirms that holds (and slightly worsens) at 40x more reads. Says nothing about the 8GB+ DBs, where cache DOES help (~2x) at 50 reads - untested at large read counts, remains open. 16-way still running.
